# The Problems We Studied

- We studied a new class of Boolean functions which are invariant under the action of Dihedral group (DSBFS).
- We studied some theoretical and experimental results in this direction.
- Efficient search for good nonlinear function in this class.
- Most interestingly, we found many 9-variable Boolean functions having nonlinearity 241 belong to this class.

- Definitions and Background

### 2 Our Results/Contribution

- Walsh Transform of DSBFs
- Investigation of the matrix  $\mathcal{M}$

# Motivation

- Let  $A$  be a set of Boolean functions.
- $A$  contains some functions having good cryptographic properties.
- $B \subset A$  contains good functions with more density.

Searching good functions in  $B$  is easier than searching in  $A$ .

Studying the functions in the set  $B$  could be better idea than studying in the set  $A$ .

# Motivation

- Let  $A$  be a set of Boolean functions.
- $A$  contains some functions having good cryptographic properties.
- $B \subset A$  contains good functions with more density.

$\therefore$  Good Function

Searching good functions in  $B$  is easier than searching in  $A$ .

Studying the functions in the set  $B$  could be better idea than studying in the set  $A$ .

Searching good functions in  $B$  is easier than searching in  $A$ .

Studying the functions in the set  $B$  could be better idea than studying in the set  $A$ .

# Motivation

- Number of  $n$ -variable Boolean functions:  $2^{2^n}$ .
- Not feasible to search exhaustively for a good function when  $n \geq 7$ .
- Lots of attempts to search in subclasses like class of **Symmetric functions** and **Rotational Symmetric functions**.
- Class sizes are  $2^{n+1}$  and  $2^{c_n}$  respectively, where 
$$c_n = \frac{1}{n} \sum_{k|n} \phi(k) 2^{n/k}.$$
- One may be tempted to take advantage of their small size.
- Symmetric class is not exciting in terms of possession of good functions.
- Rotational symmetric class contains many good functions; but infeasible to search if  $n > 9$ .
- **Motivation:** to study some other classes in between these two classes.

# Motivation

RSBF

- Literature says that the class of Rotational Symmetric Boolean functions (RSBFs) contains many cryptographically good functions.
- The class of Dihedral Symmetric Boolean functions (DSBFs) is a subclass of RSBFs.
- Is the density of good functions is high in the class of DSBFs ?

- **Is the density of good functions is high in the class of DSBFs ?**

## Outline

### 1 Motivation

- The Basic Problem That We Studied
- Motivation for the Work
- **Definitions and Background**

### 2 Our Results/Contribution

- Walsh Transform of DSBFs
- Investigation of the matrix  $\mathcal{M}$

# Boolean functions

- An  $n$ -variable Boolean function can be viewed as a mapping from  $\{0, 1\}^n$  into  $\{0, 1\}$ .
- $\mathcal{B}_n$ : the set of all Boolean functions of  $n$  variables.
- **Truth Table (TT)**: A Boolean function  $f \in \mathcal{B}_n$  can be represented by a binary string of length  $2^n$ .  
 $f = [f(0, 0, \dots, 0), f(1, 0, \dots, 0), f(0, 1, \dots, 0), \dots, f(1, 1, \dots, 1)]$ .
- **Walsh Transform of  $f$  at  $a \in F_2^n$** :

$$W_f(a) = \sum_{x \in F_2^n} (-1)^{f(x) \oplus x \cdot a}$$

- **Nonlinearity of  $f$** :  $2^{n-1} - \frac{1}{2} \max_{a \in F_2^n} W_f(a)$ .

# Boolean functions

- An  $n$ -variable Boolean function can be viewed as a mapping from  $\{0, 1\}^n$  into  $\{0, 1\}$ .
- $\mathcal{B}_n$ : the set of all Boolean functions of  $n$  variables.
- **Truth Table (TT)**: A Boolean function  $f \in \mathcal{B}_n$  can be represented by a binary string of length  $2^n$ .  
 $f = [f(0, 0, \dots, 0), f(1, 0, \dots, 0), f(0, 1, \dots, 0), \dots, f(1, 1, \dots, 1)]$ .
- Walsh Transform of  $f$  at  $a \in F_2^n$ :

$$W_f(a) = \sum_{x \in F_2^n} (-1)^{f(x) \oplus x \cdot a}$$

- Nonlinearity of  $f$ :  $2^{n-1} - \frac{1}{2} \max_{a \in F_2^n} W_f(a)$ .

# Boolean functions

**Nonlinearity of  $f$ :**  $2^{n-1} - \frac{1}{2} \max_{a \in F_2^n} W_f(a)$ .

- $n$  even: Max nonlinearity =  $2^{n-1} - 2^{\frac{n}{2}-1}$ .  
Function achieving this bound is called *bent* function.
- $n$  odd: Max nonlinearity is unknown.  
 $2^{n-1} - 2^{\frac{n-1}{2}} < nl(f) \leq 2^{n-1} - \lceil 2^{\frac{n}{2}-1} \rceil$ .

# Permutation Group

- **Permutation group** is a finite group of permutations (bijection mappings) on the elements of a given finite set with composition as group operation.
- Group of all permutations is called *Symmetric group* and denoted as  $S_n$  where  $n$  is the number of elements.
- Group of all cyclic shift permutations is called *rotation (cyclic) group* and denoted as  $C_n$ .
- Group of cyclic shift and reflection permutations is called *Dihedral group* and denoted as  $D_n$ .

# Geometric Realization of Dihedral Group

$\omega$  is the reflection (or, rotation of  $P_n$  by  $\pi$ ) about a line passing through a vertex and the center of  $P_n$ .

$$\omega^2 = e.$$

# Group Action

## Definition (Group action)

The group action of a group  $G$  on a set  $X$  is a mapping  $\psi : G \times X \rightarrow X$  denoted as  $g \cdot x$ , which satisfies the following two actions.

- 1  $(gh) \cdot x = g \cdot (h \cdot x)$ , for all  $g, h \in G$  and for all  $x \in X$ .
- 2  $e \cdot x = x$ , for every  $x \in X$ ,  $e$  is the identity element of  $G$ .

Group action of a group  $G$  on a set  $X$  forms equivalence classes under the equivalent relation  $x \sim y$  iff  $g \cdot x = y$  for  $x, y \in X$  and  $g \in G$ .

# Group Action

## Definition (Group action)

  - **Walsh Transform of DSBFs**
  - Investigation of the matrix  $\mathcal{M}$

# Walsh Transform of DSBFs

- $W_f(w) = \sum_{x \in \{0,1\}^n} (-1)^{f(x) \oplus x \cdot w}$ .
- If  $f$  is a *DSBF*, then

$$W_f(w) = \sum_{i=0}^{d_n-1} (-1)^{f(\Lambda_i)} \sum_{x \in \text{cls}(\Lambda_i)} (-1)^{x \cdot w}.$$

Let  $w, z$  are in same class and  $f$  be a *DSBF*, then  
 $W_f(w) = W_f(z)$ .

- Walsh spectra of a DSBF can be described by  $d_n$  many values.

# Walsh Transform of DSBFs

- $W_f(w) = \sum_{x \in \{0,1\}^n} (-1)^{f(x) \oplus x \cdot w}$ .
- If  $f$  is a *DSBF*, then

$$W_f(w) = \sum_{i=0}^{d_n-1} (-1)^{f(\Lambda_i)} \sum_{x \in \text{cls}(\Lambda_i)} (-1)^{x \cdot w}.$$

Let  $w, z$  are in same class and  $f$  be a *DSBF*, then  
 $W_f(w) = W_f(z)$ .

- Walsh spectra of a DSBF can be described by  $d_n$  many values.

# Walsh Transform of DSBFs

- $W_f(w) = \sum_{x \in \{0,1\}^n} (-1)^{f(x) \oplus x \cdot w}$ .
- If  $f$  is a *DSBF*, then

$$W_f(w) = \sum_{i=0}^{d_n-1} (-1)^{f(\Lambda_i)} \sum_{x \in \text{cls}(\Lambda_i)} (-1)^{x \cdot w}.$$

Let  $w, z$  are in same class and  $f$  be a *DSBF*, then  
 $W_f(w) = W_f(z)$ .

- Walsh spectra of a DSBF can be described by  $d_n$  many values.

# Computing Walsh spectra of DSBFs

$$M = \begin{matrix} & \Lambda_0 & \dots & \Lambda_i & \dots & \Lambda_{d_n-1} \\ \Lambda_0 & \left[ \begin{array}{c} \text{---} \\ | \\ \text{---} \end{array} \right] & & & & \left[ \begin{array}{c} \text{---} \\ | \\ \text{---} \end{array} \right] \\ \vdots & & & & & \\ \Lambda_i & & & \bullet & & \\ \vdots & & & & & \\ \Lambda_{d_n-1} & & & & & \end{matrix} \quad d_n \times d_n$$

$$\sum_{x \in \text{cls}(\Lambda_i)} (-1)^{x \cdot \Lambda_{n,j}}$$

Walsh spectra of  $f$  can be determined by a matrix product as

$$[(-1)^{f(\Lambda_0)}, (-1)^{f(\Lambda_1)}, \dots, (-1)^{f(\Lambda_{d_n-1})}] \mathcal{M}.$$

# Computing cryptographic numericals of DSBFs

Let  $f$  be an  $n$ -variable DSBF.

- $f$  is balanced iff  $\sum_{i=0}^{d_n-1} (-1)^{f(\Lambda_i)} M_{i,0} = 0$ .
- Nonlinearity of  $f$  is

$$nl(f) = 2^{n-1} - \frac{1}{2} \max_{\Lambda_j, 0 \leq j < d_n} \left| \sum_{i=0}^{d_n-1} (-1)^{f(\Lambda_i)} M_{i,j} \right|.$$

- $f$  is bent iff  $\sum_{i=0}^{d_n-1} (-1)^{f(\Lambda_i)} M_{i,j} = \pm 2^{\frac{n}{2}}$  for  $0 \leq j \leq d_n - 1$ .
- $f$  is  $m$ -order Correlation Immune (respectively  $m$ -resilient) iff

$$\sum_{i=0}^{d_n-1} (-1)^{f(\Lambda_i)} M_{i,j} = 0, \text{ for } 1 \text{ (respectively } 0) \leq wt(\Lambda_j) \leq m.$$

## Outline

- 1 Motivation
  - The Basic Problem That We Studied
  - Motivation for the Work
  - Definitions and Background
- 2 Our Results/Contribution
  - Walsh Transform of DSBFs
  - Investigation of the matrix  $\mathcal{M}$

## the matrix $\mathcal{M}$ for odd $n$

Let  $n$  be odd and  $x \in F_2^n$ .

- $wt(x)$  is odd iff  $wt(\bar{x})$  is even.
- $cls(x) \neq cls(\bar{x})$ .
- Order the leaders  $\Lambda_i$  as  $\Lambda_0, \dots, \Lambda_{d_n/2-1}$  are having odd weight and  $\Lambda_{d_n/2+i} = \bar{\Lambda}_i, 0 \leq i < d_n/2$ .

## the matrix $\mathcal{M}$ for odd $n$

Let  $n$  be odd and  $x \in F_2^n$ .

- $wt(x)$  is odd iff  $wt(\bar{x})$  is even.
- $cls(x) \neq cls(\bar{x})$ .
- Order the leaders  $\Lambda_i$  as  $\Lambda_0, \dots, \Lambda_{d_n/2-1}$  are having odd weight and  $\Lambda_{d_n/2+i} = \bar{\Lambda}_i, 0 \leq i < d_n/2$ .

## the matrix $\mathcal{M}$ for odd $n$

Let  $n$  be odd and  $x \in F_2^n$ .

- $wt(x)$  is odd iff  $wt(\bar{x})$  is even.
- $cls(x) \neq cls(\bar{x})$ .
- Order the leaders  $\Lambda_i$  as  $\Lambda_0, \dots, \Lambda_{d_n/2-1}$  are having odd weight and  $\Lambda_{d_n/2+i} = \bar{\Lambda}_i, 0 \leq i < d_n/2$ .

## the matrix $\mathcal{M}$ for odd $n$

Let  $n$  be odd and  $x \in F_2^n$ .

- $wt(x)$  is odd iff  $wt(\bar{x})$  is even.
- $cls(x) \neq cls(\bar{x})$ .
- Order the leaders  $\Lambda_i$  as  $\Lambda_0, \dots, \Lambda_{d_n/2-1}$  are having odd weight and  $\Lambda_{d_n/2+i} = \bar{\Lambda}_i, 0 \leq i < d_n/2$ .

The matrix after reordering:

$$M_n = \begin{array}{c} \Lambda_0 \cdots \Lambda_{d_n/2-1} \quad \bar{\Lambda}_0 \cdots \bar{\Lambda}_{d_n/2-1} \\ \left[ \begin{array}{cc} S_n & S_n \\ S_n & -S_n \end{array} \right] \\ \Lambda_0 \quad \bar{\Lambda}_{d_n/2-1} \end{array}$$

## the matrix $\mathcal{M}$ for odd $n$

The matrix after reordering:

$$M_n = \begin{array}{c} \Lambda_0 \cdots \Lambda_{d_n/2-1} \\ \Lambda_0 \\ \overline{\Lambda_0} \\ \overline{\Lambda_{d_n/2-1}} \end{array} \left[ \begin{array}{c|c} S_n & S_n \\ \hline S_n & -S_n \end{array} \right] \begin{array}{c} \overline{\Lambda_0} \cdots \overline{\Lambda_{d_n/2-1}} \\ \Lambda_0 \\ \overline{\Lambda_0} \\ \overline{\Lambda_{d_n/2-1}} \end{array}$$

- Computing  $\frac{d_n}{2} \times \frac{d_n}{2}$  matrix  $S_n$  is suffice to compute  $d_n \times d_n$  matrix  $\mathcal{M}_\setminus$ .
- 4 times advantage to compute the matrix  $\mathcal{M}_\setminus$ .
- This advantage carries to compute Walsh spectra, nonlinearity, resiliency etc.

## the matrix $\mathcal{M}$ for odd $n$

The matrix after reordering:

$$M_n = \begin{array}{c} \Lambda_0 \cdots \Lambda_{d_n/2-1} \\ \Lambda_0 \\ \overline{\Lambda_0} \\ \overline{\Lambda_{d_n/2-1}} \end{array} \left[ \begin{array}{c|c} S_n & S_n \\ \hline S_n & -S_n \end{array} \right] \begin{array}{c} \overline{\Lambda_0} \cdots \overline{\Lambda_{d_n/2-1}} \\ \Lambda_0 \\ \overline{\Lambda_0} \\ \overline{\Lambda_{d_n/2-1}} \end{array}$$

- Computing  $\frac{d_n}{2} \times \frac{d_n}{2}$  matrix  $S_n$  is suffice to compute  $d_n \times d_n$  matrix  $\mathcal{M}_\setminus$ .
- 4 times advantage to compute the matrix  $\mathcal{M}_\setminus$ .
- This advantage carries to compute Walsh spectra, nonlinearity, resiliency etc.

## the matrix $\mathcal{M}$ for odd $n$

The matrix after reordering:

$$M_n = \begin{array}{c} \Lambda_0 \cdots \Lambda_{d_n/2-1} \\ \Lambda_{d_n/2-1} \\ \overline{\Lambda_0} \\ \overline{\Lambda_{d_n/2-1}} \end{array} \left[ \begin{array}{c|c} S_n & S_n \\ \hline S_n & -S_n \end{array} \right]$$

- Computing  $\frac{d_n}{2} \times \frac{d_n}{2}$  matrix  $S_n$  is suffice to compute  $d_n \times d_n$  matrix  $\mathcal{M}_\setminus$ .
- 4 times advantage to compute the matrix  $\mathcal{M}_\setminus$ .
- This advantage carries to compute Walsh spectra, nonlinearity, resiliency etc.

# Highly nonlinear Boolean functions

- Recently [Indocrypt 2006], shown that there are Boolean functions of odd number variables having nonlinearity greater than  $2^{n-1} - 2^{\frac{n-1}{2}}$ ,  $n > 7$ .
- They showed existence of 9-variable Boolean function of nonlinearity  $241 > 2^8 - 2^4 = 240$ .
- They found  $8 \times 189$  many RSBFs having nonlinearity 241 out of  $2^{60}$  functions.
- We found  $8 \times 21$  DSBFs having nonlinearity 241 out of  $2^{46}$ .
- **Density** : 241-nonlinearity functions are  $\frac{2^{14}}{9}$  times more dense in the class of DSBFs than the class of RSBFs.
- Hope it will be happen for higher number of variables too.

## Summary

- We introduced a new class Boolean functions inbetween symmetric class and RSBFs.
- We studied some theoretical and experimental results on this class.
- Expectation that high nonlinear functions are more dense in DSBFs than RSBFs.

End

**Thanks :)**
